Interest in individualized reading has spanned four decades, and throughout this period many researchers have experimented with individualized reading instruction. A summarization of the research evidence would serve a useful purpose permitting teachers the opportunity to evaluate these investigations and to formulate a judgement about whether individualized reading can be used with successful results.

Even though the concept of individualized reading is as old as the dame schools, initial quasi-experiments with this approach seems to have occurred in the thirties when three uncontrolled studies were reported. (DeWitt and Agnew, 1937, and Loomis, 1939). These early individualized reading programs indicated to their authors that the results were favorable to the individualized approach. Conclusions such as these which are based on uncontrolled data must be accepted as opinion rather than fact. Although the nature of these reports as factual evidence is discounted, these early attempts at individualized reading did lead the way for further work in this area during the next decades.

The earliest controlled study involving individualized reading was conducted by Anderson (1946). Third grade students were the subjects with the experimental group using individualized reading and the control group using a basal program. The author reported no significant difference for the two groups.

Table I illustrates significant information about these early studies.

INSERT TABLE I HERE

By the fifties, attention became focused sharply on individualized reading. Educators had become increasingly aware that students were individuals with wide

ranges in ability and learning rate. Considering this fact, individualized reading seemed to be the most likely developmental approach taking into account the assumption that more learning occurs when students are self-paced rather than when grouped. As a result of this high tide of enthusiasm for individualizing instruction throughout the fifties and sixties, a number of studies were conducted to assess the merits of individualized reading.

At least sixteen studies were reported during the decade of the fifties. Although not all the experiments were controlled, nine of the sixteen were. Table 2 reveals the details of these investigations.

INSERT TABLE 2 HERE

Of the nine controlled studies reported in which individualized reading was the experimental treatment, seven authors reported favorable results for the experimental groups over the control groups using basal programs. Two authors reported no significant difference between the groups studied. It is noteworthy that not one basal group in these nine studies exceeded the achievement of the individualized reading groups. These results heightened the interest in individualized reading in the sixties when even more studies were reported than in the previous two and a half decades!

Many reasons caused this upsurge of interest in individualized reading both from inside the profession and outside. Reactions from the successful Sputnik venture by a foreign power caused much turbulence in education. Not only were the sciences targeted for criticism, but reading too received attention. Of course, Rudolph Flesch with his book Why Johnny Can't Read had preceded this new eruption of interest so that reading educators were already manning the defenses

when this renewed concern manifested itself. From within the profession concern developed about the traditional basal reading program. Basals were frequently challenged as making little provision for meeting individual student needs, as not being founded on sound linguistic principles, or containing sufficient phonic drill. These and other concerns seems to have led professionals in search of other materials and ideas. Many new approaches and mediums were developed to teach reading. Interest in the modified alphabets, in extrinsic phonic programs, and in the new linguistic series caused excitement furthering comparative studies, some of which involved individualized reading.

The high interest in individualized reading generated in the fifties was superceded by intensified activity with individualized reading in the sixties when thirty or more studies were reported in the literature. Besides increasing in quantity, the studies in the sixties were more frequently controlled than the earlier ones. Of the thirty investigations reviewed by this author, only one lacked controls.

In analyzing the thirty studies reported or the twenty-nine controlled ones, the most noteworthy feature is that sixteen researchers stated that the individualized reading group exceeded the control group in achievement. These studies covered all elementary grade levels and a few secondary grades. Only one study (Galotto 1961) was reported in which the control group, using basal readers and grouped into three ability groups, exceeded the achievement of the individualized reading group. Twelve studies were reported in which no significant difference was the result. Thus, the box score for the sixties reads:

Individualized Reading Groups	16
Control Groups	1
Ties	12

Table 3 reveals the studies reported in the sixties.

INSERT TABLE 3 HERE

The most recent study on individualized reading, and the only one found for the seventies, was reported by Davis and Lucas (1971). In comparing individualized reading to a basal program with seventh and eighth graders as subjects, it appeared that the IRG attained a significant superior reading rate, but the higher achievement in vocabulary and comprehension was not statistically significant.

SUMMARY - This investigator found and reviewed fifty-one studies reported in the literature on individualized reading between 1937 and 1971. Of this number, forty of these studies were controlled at least to the extent of using control groups. In twenty-four cases the results favored the individualized reading group. Only one author reported higher reading achievement for the basal control group. Fifteen researchers reported no significant difference between groups. The summary scoreboard reads:

IRG...24

CRG...1

with 15 ties

A note of caution seems warranted concerning simply quantifying the studies as revealing superiority one way or another. As most researchers know, unless a significant difference in achievement is manifested between groups, there is some reluctance on the part of researchers and editors to publish the findings. Therefore, it is a reasonable assumption that not all studies pertaining to individualized reading have been included in the literature.

CONCLUSIONS - Summarization of the publicized research pertaining to individualized reading over four decades reveals that individualized reading programs can facilitate reading achievement to the extent of basal reading programs, and that more often than not, individualized reading programs have facilitated higher reading achievement than basal programs in controlled studies. Further, the summarization reveals that individualized reading has been used successfully at practically all grade levels.

TABLE 1

<u>Year</u>	<u>Researchers</u>	<u>Grade Level</u>	<u>No. of Subjects</u>	<u>Control Group Rdg. Approach</u>	<u>Controlled Study</u>	<u>Results Favored IRG CRG</u>	<u>Additional Notes</u>
1937	Dewitt & Agnew	1	20	None	No	No basis for comparison	
1939	Gumlick	Primary	24 Classes	None	No	"	
1939	Loomis	K - 6	81	None	No	"	Researcher reported impressive results for Grades 3 through 6, but due to lack of controls, positive affirmation in favor of the individualized approach must be omitted.
1946	Anderson	3	--	Basal	Yes	No Signi. Diff.
